ChainIQ · Agentic Supply Chain Intelligence

Three AI agents turning supply chain blind spots into profit levers — demand sensing, supplier risk intelligence, and automated deduction recovery, built on Microsoft Azure.

\$3.2M

Annual recovery

8 min

Deduction batch time

35–55%

Recovery rate

THE CHALLENGE

CPG companies spend roughly 20% of revenue on trade promotions — and 72% of US trade promotions are money-losing because spend, deductions, and net revenue never reconcile until the quarter closes. 10–20% of retailer deductions are invalid retailer errors, but CPG suppliers write them off because AR teams miss the dispute window. The #1 cause of compliance chargebacks is an incorrect advance ship notice (EDI 856) with a single wrong field — triggering an automatic chargeback at the retailer's receiving dock. This is a data accuracy problem, not a delivery problem.

WHO IT'S FOR

CFOs writing off recoverable deductions every quarter without knowing the exact recoverable amount, VP Supply Chain leaders running demand planning on 13-week lagging averages while major retailer algorithms react to yesterday's POS data, and AR / Trade Managers buried in deduction volume and missing dispute windows. Target: \$50M–\$500M CPG brands and distributors selling to Walmart, Kroger, Target, HEB, and Costco.

AI CAPABILITIES

- **Demand sensing agent** — Real-time POS + supply signals replace 13-week lagging averages
- **Supplier risk intelligence** — Continuous scoring of supplier reliability and lead-time variance
- **Automated deduction recovery** — Dispute drafting + filing inside retailer windows

BUSINESS VALUE

Recover \$3.2M annually in retailer deduction disputes. Reduce stockouts by 20–40% and inventory carrying costs by 15–25%. Process full deduction batches in 8 minutes vs. 3 days manually. 35–55% of previously written-off deductions recovered through AI disputes. Typical ROI in 10–16 months.

BUILT ON

D365 Supply Chain · Azure Data Factory · Microsoft Fabric · Azure OpenAI · Azure Service Bus · Power Automate

HEALTHCARE

ClearPath AI · Autonomous Prior Authorization

Autonomous prior authorization and revenue recovery — an AI agent that fights payer denials so physicians don't have to, built on Microsoft Azure.

4 min

Auth submission time

35–55%

Denial rate cut

1.5–3%

Net revenue recovered

THE CHALLENGE

Health insurers have deployed AI to generate denials at scale. Providers are fighting back with the same manual process they used in 1994 — and losing. Each of 900+ payers has a completely different portal, form, criteria set, and appeal window. 46% of prior auth denials are caused by missing or inaccurate administrative data — not clinical disagreement. 67% of physicians don't appeal denials because they believe it's futile — learned helplessness that costs the average 50-physician practice \$1.4M per year in recoverable revenue left on the table.

WHO IT'S FOR

CFOs writing off 3–5% of gross revenue in preventable denials every year, CMOs with physicians completing 40+ prior auth requests per week (26% have watched a patient deteriorate waiting on payer bureaucracy), and RCM Directors managing teams manually working claim queues — a job description that shouldn't exist in 2026. Target: Multi-specialty medical groups (20–200 physicians), regional health systems, and hospital networks with complex payer mixes.

AI CAPABILITIES

- **Payer policy parsing** — Reads each payer's 900+ unique criteria sets continuously
- **Auth packet drafting** — Builds clinical justification + admin data in 4 minutes
- **Denial appeal automation** — Auto-files appeals inside the payer's narrow window
- **Revenue-at-risk scoring** — Quantifies recoverable revenue per claim queue

BUSINESS VALUE

Reduce auth submission time from 47 minutes to 4 minutes. Cut denial rates by 35–55%. Recover 1.5–3% of net revenue. \$2.1M+ recovered at a 54-physician group in year one. Physicians reclaim 3–5 hours of admin time per week. Typical ROI in 6–12 months.

BUILT ON

Azure Health Data Services (FHIR R4) · Azure OpenAI · Azure API Management · Microsoft Fabric · Copilot Studio

MANUFACTURING

ConfigureFlow — Engineered Quote Studio

An agent team turns a messy inbound RFQ into a validated, priced, plant-scheduled quote in minutes — with margin-floor approval routing built in.

<10 min

Quote turnaround (from 1–2 days)

35%

Quote-cycle-time reduction

20%

Fewer pricing/config errors

THE CHALLENGE

Make-to-order manufacturers and industrial distributors build complex configured quotes by hand — re-keying spec sheets, checking compatibility rules, pricing line items, and confirming plant capacity across disconnected systems. A complex quote takes 1–2 days, margin leaks through configuration and pricing errors, and sales engineers spend more time assembling quotes than winning them.

WHO IT'S FOR

Sales engineering, inside sales, and revenue operations at engineered-product manufacturers (ventilation, displays, cable/connectivity, structures, refrigeration) and PVF/pump/MRO distributors. Economic buyer: VP Sales / VP Commercial Operations.

AI CAPABILITIES

- **Spec-sheet intake** — Parses inbound RFQ emails and PDF schedules into structured requirements
- **Rule-based configuration** — Validates the build against compatibility rules and proposes compliant substitutes
- **Margin-aware pricing** — Prices line items, applies discount tiers, checks against the margin floor
- **Capacity-aware scheduling** — Checks multi-plant capacity and long-lead components for the earliest ship date
- **Discount-approval routing** — Routes below-floor quotes to the right approver by deal size, with logged justification

BUSINESS VALUE

Cuts quote turnaround from 1–2 days to under 10 minutes and protects margin on every quote — a conservative 3–5x return in year one for a mid-sized sales-engineering team.

PROFESSIONAL SERVICES

Counsel IQ · Matter & Billing Intelligence

The firm's institutional memory — connected, active, and billing. Matter intelligence, automated billing capture, and contract review built on Microsoft 365 and Azure.

\$780K

Annual recovery

+1–2

Billable hrs/attorney/wk

20–35%

Write-off reduction

THE CHALLENGE

Attorneys reconstruct their day from memory at 6 PM — or worse, on Friday. Research shows waiting one day to log time loses 10% of billable hours; waiting a week loses 25%+. That 7-minute strategy call in the hallway, the email thread answering client questions, the quick document review during lunch — all gone. One in five internal assignments is dropped at firms without automated task tracking, costing the average 15-attorney firm \$487K annually. Partners write down perfectly earned time because vague narratives don't survive client scrutiny — all problems that live inside M365 data the firm already owns.

WHO IT'S FOR

Managing Partners accountable for firm economics who know write-downs are a problem but lack the data to quantify the exact magnitude, Equity Partners with a direct financial stake in billing realization (every recovered hour translates directly to personal draw), and CFO/COO teams managing utilization rates, WIP aging, and realization from reports that are always a week stale. Target: Law firms, CPA firms, and consulting practices with 20–200 professionals already on Microsoft 365 E3.

AI CAPABILITIES

- **Passive time capture** — Auto-reconstructs the billable day from M365 signals
- **Matter intelligence** — Connects emails, docs, meetings, tasks per matter
- **Contract review acceleration** — Azure OpenAI markup vs. firm playbook
- **Realization analytics** — WIP aging + write-off forecasting per partner

BUSINESS VALUE

Recover \$780K annually at a 50-attorney firm. Recapture 1–2 billable hours per attorney per week, every week. Reduce write-offs by 20–35%. Contract review 60–75% faster. 4:1 ROI on platform cost. Fastest ROI in the portfolio: 4–8 months.

BUILT ON

Microsoft 365 E5 + Copilot · Copilot Studio · Azure OpenAI · Azure AI Search · D365 Business Central · Power Automate

DeliverIQ · AI Material Verification

AI-powered job site material verification — photograph a delivery, reconcile against the PO, and close the payment loop in under 3 minutes.

\$340K

Annual shortage recovery

2.1 min

Verification time

94.2%

AI Vision confidence

THE CHALLENGE

Material receipt at job sites is entirely manual — a field hand counts pipe by eye and initials a paper ticket with no verification. Shortages go undetected at receipt, surfacing weeks later during invoice reconciliation when it's too late to dispute. There is no digital chain of custody between delivery, work order, and payment — AP teams operate blind until the invoice arrives. Field workers lack tools to verify complex material manifests on mobile without back-office support. Vendor payment disputes are slow, undocumented, and rarely recover full shortage value.

WHO IT'S FOR

Field Supervisors and Operators photographing and verifying deliveries at the laydown yard or pad site on mobile, Procurement and AP Teams receiving real-time shortage flags and payment hold triggers to eliminate manual invoice reconciliation cycles, and Project and Construction Managers who need verified material receipt tied to work order status to keep job schedules on track.

AI CAPABILITIES

- **Photo-based material count** — Azure AI Vision identifies + counts items from a single photo
- **PO reconciliation** — Auto-matches delivery against active PO in D365
- **Shortage flagging** — Real-time payment hold + AP alerting
- **Mobile-first capture** — Power Apps + Teams for field-tech workflows

BUSINESS VALUE

\$340K estimated annual shortage recovery per operator. AI verification completes in 2.1 minutes vs. 35-minute manual process. 94.2% Azure AI Vision object identification confidence. Eliminates paper delivery tickets and creates a full auditable chain of custody in D365.

BUILT ON

Azure AI Vision · Azure OpenAI Service · Power Automate · Dynamics 365 Supply Chain · Power Apps · Microsoft Teams

MANUFACTURING

EdgeSentry — Connected-Fleet Predictive Maintenance

A monitoring agent team detects, diagnoses, and predicts asset failures across a connected fleet, then schedules the fix during off-hours — before an outage happens.

30%

Unplanned-downtime reduction

18%

Maintenance-cost reduction

4–5x

Cheaper than emergency repair

THE CHALLENGE

Manufacturers ship increasingly connected equipment that streams telemetry, but that data rarely turns into action. Failures are caught after downtime, service stays reactive, and the connected-product investment never pays off in uptime or customer experience. A single failed asset can mean a food-safety loss, a dark display at a sold-out event, or an emergency truck roll.

WHO IT'S FOR

Connected-products, digital, and aftermarket-service leadership at connected-equipment makers (refrigeration, displays, networked industrial gear). Economic buyer: Chief Digital/Product Officer or VP Service.

AI CAPABILITIES

- **Anomaly detection** — Watches streaming telemetry and flags deviations from each asset's baseline
- **Failure-signature diagnostics** — Matches anomaly patterns to known failure modes with confidence
- **Remaining-useful-life prediction** — Estimates time-to-failure and the cost of inaction
- **Proactive scheduling** — Books service in a low-usage window with parts reserved and tech assigned
- **False-positive learning** — Dismissed anomalies tune the baseline and improve precision over time

BUSINESS VALUE

Converts unplanned outages into planned, off-hours service — a conservative 30% cut in unplanned downtime and 18% lower maintenance cost, with proactive repairs costing a fraction of emergency ones.

BUILT ON

Azure IoT Hub · Azure AI Foundry · Azure OpenAI · Azure AI Search · Azure Web PubSub · Azure Kubernetes Service · Azure Service Bus · Azure Key Vault

FinShield AI · AML & Loan Intelligence

Autonomous financial crime detection and loan intelligence — three AI agents continuously monitoring transactions, refreshing KYC profiles, and generating complete SAR filings before a human analyst opens their laptop.

3 min

SAR narrative time

60–70%

AML case time cut

40–55% faster

Loan origination

THE CHALLENGE

AML investigators spend 70% of their time gathering data across 5–7 disconnected systems — not analyzing it. Rules-based monitoring generates 95–99% false positive rates, meaning analysts clear noise all day and miss real risk. TD Bank paid \$3B in fines in 2024 — not because they lacked technology, but because their tools were never connected to 92% of transaction volume. Loan origination suffers the same integration failure: documents validated manually across siloed systems, adding weeks to every deal cycle.

WHO IT'S FOR

Chief Compliance Officers drowning in AML case volume, facing regulatory pressure from Basel IV and DORA, and personally liable for filing failures; CFO / COO teams watching \$61B/year in North American compliance costs with no reduction in actual crime detection rates; Heads of Lending losing deals to faster competitors while loan origination sits at 45+ day average cycle times. Target: Community banks and regional insurers with \$500M–\$5B AUM that already have Microsoft 365 deployed with Copilot licenses unused.

AI CAPABILITIES

- **Transaction monitoring agent** — Continuous behavioral scoring across all rails
- **KYC refresh agent** — Auto-updates risk profiles from public + internal signals
- **SAR narrative drafting** — Azure OpenAI assembles regulator-ready filings in 3 min
- **Loan document intelligence** — Copilot Studio orchestrates underwriting docs across systems

BUSINESS VALUE

Generate SAR narratives in 3 minutes vs. 3–5 days. Reduce AML case time by 60–70%. Accelerate loan origination by 40–55%. 83% digital resolution rate. 2–3× fraud detection improvement vs. rules-only systems. Typical ROI in 9–14 months.

BUILT ON

Azure OpenAI · Microsoft Fabric · Dynamics 365 Finance · Microsoft Purview · Copilot Studio · Power Automate

MANUFACTURING

Forge AI · Plant Floor Intelligence

Three AI agents running your plant floor 24/7 — predictive maintenance, quality intelligence, and frontline knowledge, built on Microsoft Azure.

\$4.1M

Cost avoidance / event

25–45%

Downtime reduction

81 !' 49 min

MTTR

THE CHALLENGE

The average US plant burns 800 hours of production per year to breakdowns it could have predicted. Sensors are deployed — but they're feeding data historians and data lakes that nobody monitors in real time. When a machine fails, technicians spend the first 20–30 minutes locating the right service manual and calling a more experienced colleague. None of that is repair work. As 40% of the skilled trades workforce retires this decade, that institutional knowledge disappears with them. Forge AI captures it before it walks out the door.

WHO IT'S FOR

Plant Managers accountable for OEE and uptime who already have IoT sensors but nobody is reading the data in real time, VP Operations facing a skilled trades retirement wave and \$253M/year in average plant losses from unplanned breakdowns, and Maintenance Directors running reactive maintenance because their CMMS is a calendar, not a prediction engine. Target: Mid-market discrete or process manufacturers with \$50M–\$500M revenue, 1–5 production lines, and Microsoft 365 deployed.

AI CAPABILITIES

- **Predictive maintenance** — Vibration + thermal + acoustic pattern matching per line
- **Quality intelligence** — Vision + telemetry to catch reject conditions before scrap
- **Frontline knowledge agent** — Captures retiring-tech expertise + serves it on demand in Teams

BUSINESS VALUE

\$4.1M cost avoidance per prevented failure event. Reduce unplanned downtime by 25–45%. Cut mean time to repair from 81 minutes to 49 minutes. 25–35% quality reject rate reduction. Typical ROI in 8–14 months.

BUILT ON

Azure IoT Hub · Azure AI Foundry · Dynamics 365 Field Service · Microsoft Teams · Azure OpenAI

Iron Scout RTI · Midstream Real-Time Intelligence

Mission-control anomaly detection across pipeline and compressor assets — from sensor spike to dispatched work order in under 2 minutes.

\$8.4M

Annual value projected

4 min

Detection time

82%

MTTR reduction

THE CHALLENGE

Operators are sitting on massive volumes of real-time SCADA and IoT sensor data that is almost entirely untapped. Anomaly detection is reactive — teams find out about equipment failures hours after thresholds are first breached. Work orders are created manually only after field staff report an issue, not when sensor data first shows a pattern. There is no physics-based failure mode context — alerts say a threshold was crossed but not what that means or what happens next. Maintenance history, telemetry, and work orders live in three separate systems with no connecting intelligence layer.

WHO IT'S FOR

Operations Center Managers monitoring asset health across multiple stations in real time, Field Technicians receiving work orders and acknowledgment requests via Microsoft Teams on mobile, and VP of Operations / COO focused on reducing unplanned downtime costs and mean time to repair (MTTR).

AI CAPABILITIES

- **Predictive failure detection** — Vibration + temperature pattern matching across 47 compressor units
- **Anomaly scoring** — Azure AI Foundry models score 1,247 streams/sec
- **Auto-dispatch** — D365 Field Service work-orders triggered without human routing
- **Teams alerting** — Field-tech briefings via Microsoft Teams in <30s

BUSINESS VALUE

\$8.4M estimated annual value at 47 monitored assets. Agent detects anomalies in 4 minutes vs. 6.2-hour manual average. Prevents \$94K/day in production losses per offline compressor station.

BUILT ON

Microsoft Fabric RTI · Azure IoT Hub · Azure AI Foundry · Copilot Studio · Dynamics 365 Field Service · Microsoft Teams

MANUFACTURING

MergeDesk — Acquisition Integration Room

An agent crew maps catalogs, dedupes master data, and risk-scans contracts on Day 1 — turning a six-week post-close scramble into an afternoon, with quantified synergy and surfaced legal risks.

6 wks !' days

Time to Day-1 readiness

12%

Savings on addressable spend

10x

ROI on procurement consolidation

THE CHALLENGE

Serial acquirers, merging companies, and PE carve-outs inherit mismatched product catalogs, duplicated customer and vendor master records, and stacks of contracts with hidden change-of-control and pricing risks. Manual reconciliation takes weeks per deal, delays Day-1 readiness, surfaces legal risks too late, and leaves synergy uncaptured.

WHO IT'S FOR

Corporate development, integration management offices, finance, and IT at serial acquirers, recently merged industrials, and PE-owned carve-outs. Economic buyer: VP Corporate Development, CFO, or Integration Lead.

AI CAPABILITIES

- **Catalog mapping** — Fuzzy-matches SKUs across both catalogs with confidence scoring
- **Master-data dedup** — Builds golden records with full source lineage and reversible merges
- **Contract intelligence** — Extracts terms and flags change-of-control and pricing risk from PDFs
- **Synergy quantification** — Identifies duplicate suppliers and quantifies consolidation savings
- **Confidence-banded bulk review** — Auto-approves high-confidence matches; queues the uncertain band for humans

BUSINESS VALUE

Compresses Day-1 reconciliation from ~6 weeks to days, surfaces contract risk immediately, and accelerates procurement-synergy capture — typically 10x ROI on the integration-procurement workstream.

BUILT ON

Azure AI Foundry · Azure OpenAI · Azure AI Search · Azure AI Document Intelligence · Microsoft Purview · Azure Kubernetes Service · Azure Service Bus · Azure Key Vault

NomAgent · Agentic Pipeline Scheduling

Agentic pipeline nomination and scheduling — from variance detection to re-nomination in minutes, not hours.

\$1.8M

Annual revenue protection

4.2 min

Agent response time

47 min

Manual baseline

THE CHALLENGE

Pipeline nomination and scheduling is entirely manual — spreadsheets, phone calls, and email chains across multiple counterparties. Variance detection happens hours after the fact, after revenue has already been lost. Schedulers have no unified view across shippers, pipelines, and cycles in a single screen. NAESB re-nomination windows are narrow — by the time a variance is flagged manually, the window has often already closed. There is no automated loop between scheduling, maintenance events, and contract management.

WHO IT'S FOR

Pipeline Schedulers and Nom Operators managing nominations across shippers, cycles, and pipelines daily, VP of Supply and Trading focused on revenue at risk, variance trends, and counterparty exposure, and CFO / Commercial Finance who approves the business case and needs to see the dollar value of variance recovery and margin protection.

AI CAPABILITIES

- **Variance detection** — Continuous monitoring across shippers + cycles
- **Auto re-nomination** — Drafts NAESB-compliant re-noms inside the window
- **Counterparty messaging** — Teams + email auto-coordination with shippers

BUSINESS VALUE

\$1.8M estimated annual revenue protection per midstream operator. Agent response in 4.2 minutes vs. 47-minute manual baseline. 94% agent confidence on variance detection and re-nomination. \$124,400 in revenue protected month-to-date (demo scenario).

BUILT ON

Microsoft Fabric RTI · Azure Event Hub · Azure OpenAI Service · Copilot Studio · Dynamics 365 · Microsoft Teams

UTILITIES

RateCase Navigator · Regulatory Affairs Intelligence

An agentic regulatory affairs coordination platform for utilities — orchestrating discovery requests, commitments, filings, audit trails, and executive reporting across the entire rate case lifecycle.

4.2 days

Discovery response

\$2.5M–\$4.1M

Filing cost reduction

4×

Commitments captured

THE CHALLENGE

Modern rate cases are operationally chaotic. Utilities coordinate thousands of filing documents, discovery requests, commitments, Teams conversations, email chains, testimony drafts, and regulatory deadlines across dozens of stakeholders over 12–18 month proceedings. Most utilities still manage this work manually using disconnected SharePoint folders, spreadsheets, Teams chats, and Outlook threads. Discovery requests are duplicated, commitments are lost, procedural deadlines are missed, and institutional context disappears across siloed systems. A single undocumented commitment or missed response deadline can result in millions in disallowed cost recovery. RateCase Navigator creates a centralized orchestration layer across regulatory operations — continuously coordinating filings, surfacing obligations, tracking commitments, assembling discovery responses, preserving audit defensibility, and generating executive visibility across the entire proceeding lifecycle.

WHO IT'S FOR

VP Regulatory Affairs leaders coordinating multi-year general rate case proceedings with hundreds of discovery requests and cross-functional stakeholders; Regulatory Case Managers responsible for filing defensibility, procedural compliance, and deadline execution; Legal and Compliance teams managing privileged communications, audit trails, and evidentiary documentation; and Utility CIOs modernizing regulatory operations around Microsoft 365, Purview governance, and AI-enabled coordination. Target: Investor-owned electric, gas, and water utilities managing complex state or federal regulatory proceedings.

AI CAPABILITIES

- **Discovery response orchestration** — Semantic retrieval across the regulatory corpus + automated response packet assembly
- **Commitment tracking** — Continuous extraction of obligations from Teams, email, meetings, and SharePoint activity
- **Filing deadline intelligence** — Proactive surfacing of upcoming procedural deadlines + dependency mapping
- **Audit-defensible governance** — Purview-backed chain-of-custody + privileged-communication classification

BUSINESS VALUE

Reduce average discovery response time from 9.8 days to 4.2 days through AI-assisted coordination and document intelligence. Eliminate missed filing deadlines and undocumented commitments that create regulatory exposure and disallowed cost recovery risk. Reduce outside counsel and filing coordination costs by an estimated \$2.5M–\$4.1M per rate case for large investor-owned utilities. Capture and track 4× more commitments across meetings, Teams, email, and SharePoint activity. Typical ROI achieved within a single filing cycle.

BUILT ON

Microsoft 365 · Microsoft Graph · SharePoint Online · Microsoft Teams · Azure OpenAI · Azure AI Search · Microsoft Purview · Dynamics 365 Project Operations · Power BI · Azure Service Bus

SafeSignal · Conversational Safety Intelligence

A conversational safety agent that captures near-misses and incidents in under 60 seconds — no forms, no friction, no missed reports.

48 sec

Report time

\$42K/yr

Insurance premium cut

4.6×

Near-misses captured

THE CHALLENGE

Near-miss reporting rates across O&G are a fraction of actual events — field workers won't fill out a 5-step form after a 12-hour shift. Companies know near-miss data is critical to preventing the next recordable incident, but reporting tool adoption consistently fails due to friction. OSHA classification, PSM applicability, and corrective action assignment all happen manually — creating compliance gaps. Safety managers have no real-time visibility into hazard patterns until weekly reports, by which time a recurring risk may have resulted in an incident. Corrective actions are assigned but rarely tracked to closure — the accountability loop is broken.

WHO IT'S FOR

Field Workers and Operators who talk to SafeSignal like a text message — no forms, no logins, works via voice with gloves on; Safety Managers and HSE Teams with a real-time feed of all reports, pattern alerts, OSHA classification, and corrective action tracking in one dashboard; and VP of HSE / COO focused on OSHA recordable rates, insurance premiums, PSM compliance, and safety culture scores.

AI CAPABILITIES

- **Conversational capture** — Voice or text — works with gloves on, no logins
- **OSHA auto-classification** — Azure AI Language tags PSM applicability + recordable status
- **Pattern surfacing** — Real-time hazard clustering before incidents recur
- **Corrective-action loop** — Auto-assigned + tracked to closure in D365

BUSINESS VALUE

Average report time of 48 seconds vs. 12-minute paper-based process. \$42K estimated annual insurance premium reduction per site. 4.6× more near-misses captured vs. industry average headcount. Supports OSHA PSM (29 CFR 1910.119), EPA RMP, and ISO 45001 compliance.

BUILT ON

Microsoft Copilot Studio · Azure AI Language · Azure OpenAI Service · Power Automate · Power BI · Dynamics 365 · Microsoft Teams

MANUFACTURING

ServiceMesh — Aftermarket & Warranty Triage

An agent team triages the fault, validates warranty against the exact clause, ranks likely causes from the manuals, and dispatches the right tech with the right part — before a human touches the ticket.

70%!’90%

First-time-fix rate

15–20%

Lower warranty cost

11 min

Avg time-to-dispatch (from 2.5 hr)

THE CHALLENGE

Manufacturers with large installed bases run reactive, document-heavy aftermarket service. Tickets are triaged by hand, warranty status lives in a separate system, technicians arrive without the right parts, and fixes aren't captured for next time. The result is slow dispatch, low first-time-fix rates, warranty leakage, and wasted truck rolls — on what should be the highest-margin, most retentive part of the business.

WHO IT'S FOR

Aftermarket and field-service operations, warranty administration, and service leadership at equipment manufacturers. Economic buyer: VP Service / VP Aftermarket.

AI CAPABILITIES

- **Fault triage** — Classifies the inbound request and sets severity from text, photo, and telemetry
- **Warranty validation with clause citation** — Checks coverage and cites the exact warranty clause for any denial
- **Root-cause ranking (RAG)** — Searches manuals and past tickets to rank likely causes with citations
- **Parts + technician matching** — Reserves the right part from the nearest depot and assigns a qualified tech
- **Logged override + escalation** — Coordinators can override a denial with a reason; unresolvable cases escalate

BUSINESS VALUE

Lifts first-time-fix from ~70% toward ~90%, cuts warranty leakage 15–20%, and removes repeat truck rolls — turning aftermarket from a cost center into retained margin.

BUILT ON

Azure AI Foundry · Azure OpenAI · Azure AI Search · Azure AI Document Intelligence · Azure Kubernetes Service · Azure Service Bus · Azure Key Vault · Microsoft Entra ID

MANUFACTURING

SourceGuard — Procurement Situation Room

When a cost spike or lead-time slip hits, an agent team quantifies exposure, sources qualified alternatives, models dual-source scenarios, and stages the POs — within a spend-authority guardrail — before margin erodes.

8 min

Exposure-to-PO response

\$410K

Margin protected per event

90%

Faster sourcing cycle

THE CHALLENGE

Tariffs, inflation, and supplier volatility hit industrial margins hard, but procurement reacts late because demand, supplier, and market data live in separate systems. Exposure isn't quantified until it's already costing money, and finding qualified alternatives is a manual scramble across spreadsheets and supplier emails.

WHO IT'S FOR

Procurement, supply-chain, and operations leadership at industrial manufacturers and distributors. Economic buyer: VP Supply Chain / Chief Procurement Officer / CFO.

AI CAPABILITIES

- **Demand-signal analysis** — Reads open orders and forecast to compute committed input volume and timing
- **Market & tariff watch** — Surfaces cost moves, tariff changes, and lead-time slips and quantifies exposure
- **Qualified-alternative sourcing** — Searches approved suppliers and alternates with price, lead time, and risk
- **Scenario modeling** — Compares stay vs. switch vs. dual-source and recommends an option
- **Spend-authority routing** — Stages POs but routes anything over the limit to the right approver

BUSINESS VALUE

Quantifies cost exposure in minutes and protects margin through proactive, qualified dual-sourcing — recovering six figures of margin per significant cost event under tariff and inflation pressure.

BUILT ON
